Mixtures of Airborne Substances

Use with Chapter 296-841 WAC, Respiratory Hazards

This tool will assist you in determining if a mixture of airborne substances is a respiratory hazard. Use this tool when the concentration of each substance in the mixture is below the PEL for that substance.

- Use the following formula to determine if a respiratory hazard is present when an employee is exposed to a mixture of two or more airborne substances that are potential respiratory hazards, and the substances have additive health effects:

$$E_m = \frac{C_1}{L_1} + \frac{C_2}{L_2} + \dots + \frac{C_n}{L_n}$$

The symbol	Is the
E	Equivalent exposure for the mixture. When the value of E is greater than 1 a respiratory hazard is present.
C	Concentration of a substance.
L	TWA, STEL, or ceiling for that contaminant, from Table 3.

Step 1 : Identify the health effects of the substances

- Look up the health effects in Table HT-1, which contains the health effects that were used as the basis for the PEL of each substance.
or
- Look up the health effects for the substances in the TLV booklet published by ACGIH.
or
- Use other available source, such as MSDS, RTECS, etc., to identify health effects for the substances

-Continued-

(Continued)

Step 2 : Compare the health effects

- If the same health effect is listed for each substance, the substances have additive health effects.
- You may use resources such as the documentation for the TLVs, OSHA preambles, and published articles to determine that the same listed health effects are not additive. Examples of when the effects would not be additive are:
 1. The toxic effects of the substances on the target organ are different.
 2. The substances affect different target organs.
 3. The mixture inhibits the toxic effect of one or more substance.
 4. The mixture increases the toxic effect of one or more substance (synergism). Synergism is a serious hazard that would be evaluated separately.

Step 3 : Look up the PELs in Table HT-1

- Use the TWA₈, STEL, or ceiling PEL value for the substances. Any PEL (TWA₈, STEL, or ceiling) will work in the formula but you must use the same time duration for all substances. For example, you cannot use an 8-hour sample and a 15-minute sample together.
- Multiple calculations may be needed to address all possible combinations, for example:

Substance A	Substance B
TWA ₈	TWA ₈
STEL	STEL
STEL	ceiling
ceiling	STEL
ceiling	ceiling

-Continued-

Use with Chapter 296-841 WAC, Respiratory Hazards

(Continued)

Step 4 : Determine the employee exposure concentrations

- Use air monitoring results for the time period covered by the PEL for each substance.

Step 5 : Plug the PEL and exposure concentration values into the formula and calculate the result

Example values:

Substance	TWA ₈ Results (PEL)	STEL Results (PEL)	Health Effects
n-Hexane	20 ppm (50)	40 ppm (75)	Irritation, CNS, Neuropathy
sec-Butyl acetate	20 ppm (200)	150 ppm (250)	Irritation
Methyl ethyl ketone	90 ppm (200)	120 ppm (300)	Irritation, CNS

$$E_m = \frac{C_1}{L_1} + \frac{C_2}{L_2} + \dots + \frac{C_n}{L_n}$$

Calculation for irritation TWA₈:

$$E_m = \text{n-Hexane} + \text{sec-Butyl acetate} + \text{Methyl ethyl ketone}$$

$$E_m = 20/50 + 20/200 + 90/200$$

$$E_m = 0.4 + 0.1 + 0.45$$

$$E_m = 0.95$$

The sum is less than 1, so the mixture is **not** a respiratory hazard.

-Continued-

Mixtures of Airborne Substances

Use with Chapter 296-841 WAC, Respiratory Hazards

(Continued)

Calculation for irritation STEL:

$$E_m = 40/75 + 150/250 + 120/300$$

$$E_m = 0.53 + 0.75 + 0.4$$

$$E_m = 1.68$$

The sum is greater than 1, so the mixture is a respiratory hazard.

Calculation for CNS TWA₈:

$$E_m = 20/50 + 90/200$$

$$E_m = 0.4 + 0.45$$

$$E_m = 0.85$$

The sum is less than 1, so the mixture is NOT a respiratory hazard.

Calculation for CNS STEL:

$$E_m = 40/75 + 120/300$$

$$E_m = 0.53 + 0.4$$

$$E_m = 0.93$$

The sum is less than 1, so the mixture is NOT a respiratory hazard.
